Introduction

Dmitri Loguinov
Texas A&M University

September 3, 2019
Updates

- Recv loop reminder
  - `timeout.tv_usec` must be initialized to zero
  - NULL-terminate `buf` before searching with `strchr` or `strstr`

```c
while (true) {
    FD_SET (...);
    if ((ret = select (0, &fd, ..., &timeout)) > 0) {
        // new data available; now read the next segment
        int bytes = recv (sock, buf + curPos, allocatedSize - curPos, ...);
        if (errors)
            // print WSAGetLastError() & return false;
        if (connection closed) {
            buf[curPos] = NULL;
            return true; // normal completion
        }
        curPos += bytes; // adjust where the next recv goes
        if (allocatedSize - curPos < THRESHOLD)
            // realloc() buf to double its size
    }
    else if (timeout)
        // report timeout & return false;
    else
        // print WSAGetLastError() & return false;
}
```

Chapter 1: Roadmap

1.1 What is the Internet?
1.2 Network edge
1.3 Network core
1.4 Network access and physical media
1.5 Internet structure and ISPs
1.6 Delay & loss in packet-switched networks
1.7 Protocol layers, service models
1.8 History
The Internet: “Nuts and Bolts” View

- **1) Hosts** (end systems)
  - Computing devices (servers, desktops, phones, laptops)
  - Run network apps

- **2) Routers**
  - Forward packets (chunks of data) to destinations

- **3) Communication links**
  - Connect hosts & routers
  - Fiber, copper, radio, satellite
  - Transmission rate = *bandwidth*
The Internet: “Nuts and Bolts” View

- 4) Protocols
  - Control sending/receiving of messages (e.g., TCP, IP, HTTP, FTP, SMTP)

- Internet: “network of networks”
  - Loosely hierarchical

- Who rules the Internet?
  - No single authority, mostly decentralized

- Internet standards
  - IETF: Internet Engineering Task Force
  - RFC: Request for comments
What’s a Protocol?

Human protocols:
• “What’s the time?”
• “I have a question”
• Introductions

… specific msgs sent
… specific actions taken when msgs received or other events take place

Network protocols:
• Machines rather than humans
• All communication activity in the Internet governed by protocols

Protocols define format, order of messages sent and received among network entities, and actions taken on message transmission/receipt
What’s a Protocol?

A human protocol and a computer network protocol:

- **Hi**
- **Got the time?**
- **2:00**
- **Thanks**
- **You’re welcome**

- **TCP connection request**
- **TCP connection accept**
- **GET index.html**
- **<file>**
- **connection close**
- **OK**
**Closer Look at Network Structure**

- **Network edge:**
  - Applications and hosts
- **Network core:**
  - Routers
  - Links
- **How large is the edge?**
  - Billions of hosts, trillions of web pages, zettabytes of information
- **Large ISPs form the Internet backbone**
  - Terabits per second router speed
Chapter 1: Roadmap

1.1 What is the Internet?
1.2 Network edge
1.3 Network core
1.4 Network access and physical media
1.5 Internet structure and ISPs
1.6 Delay & loss in packet-switched networks
1.7 Protocol layers, service models
1.8 History
Network Edge

- **The edge:**
  - Responsible for almost all data supply/demand
  - Protocols impact performance

- **Client/server model**
  - Client host requests, receives service from always-on server
  - **Example:** web browser/server; email client/server

- **Peer-to-peer (P2P) model:**
  - Minimal use of dedicated servers; user hosts talk to each other
  - **Example:** Skype, BitTorrent
Network Edge: Reliable Service

- **Goal**: data transfer between sockets
- TCP – Transmission Control Protocol
  - Internet’s reliable service
- **Connection-oriented**
  - *Handshaking*: send connection messages (prepare) for data transfer ahead of time
  - Set up *state* in two communicating hosts

TCP service [RFC 793]
- **Reliable, in-order** byte-stream data transfer
  - Packet loss handled through acknowledgements and retransmissions
- **Flow control**:
  - Sender won’t overwhelm receiver
- **Congestion control**:
  - Senders reduce transmission rate when network becomes congested
Network Edge: Unreliable Service

• **Goal:** data transfer between sockets
  - Same as before!
• **UDP** – User Datagram Protocol [RFC 768]:
  - Connectionless
  - Unreliable data transfer
  - No flow control
  - No congestion control
• **Less overhead and delay**
  - TCP connection setup & termination is 7 packets
  - TCP retransmission delay is potentially unbounded

**Apps using TCP:**
• HTTP (Web), FTP (file transfer), SSH (remote login), SMTP (email)

**Apps using UDP:**
• DNS, SNMP
  - Short (single-packet) transfers
  - No need for congestion management
• Streaming media, online games, IP telephony
  - More sensitive to delay than packet loss
Chapter 1: Roadmap

1.1 What is the Internet?
1.2 Network edge
1.3 Network core
1.4 Network access and physical media
1.5 Internet structure and ISPs
1.6 Delay & loss in packet-switched networks
1.7 Protocol layers, service models
1.8 History
The Network Core

- Supports end-host communication
- **Fundamental question:** how is data transferred through the network?
  - **Circuit switching:** dedicated circuit per call (telephone network, origin 1800s)
  - **Packet-switching:** data sent in discrete “chunks” (1960s)
- **Notation**
  - Call = connection = flow
Network Core: Packet Switching

- End-end data stream divided into **packets**
  - Packets of users A and B *share* network resources
  - Each packet uses full link bandwidth

- **Resource contention:**
  - Aggregate resource demand can exceed amount available
  - *Congestion*: packets queue, wait for link use

- **Store-and-forward:**
  - Packets move one hop (router) at a time
  - Node receives complete packet before forwarding
Packet Switching: Statistical Multiplexing

- Sequence of A’s and B’s packets does not have a fixed pattern \(\Rightarrow\) statistical multiplexing
Packet Switching vs. Circuit Switching

Packet switching allows more users than circuit switching

- 1 Mbps link
- Each user:
  - 100 Kbps when “active”
  - Active 10% of time
- Circuit-switching:
  - Supports 10 users
- Packet switching:
  - With 35 users, probability that more than 10 are active is 0.0424%; with 50 users – 0.94%
  - Max 100 users (if perfectly unsynchronized)
Packet Switching: Store-and-Forward

• Takes $L/R$ seconds to transmit (push out) packet of $L$ bits on to link of $R$ bps
• Entire packet must arrive at router before it can be transmitted on next link: store and forward
• Path delay $= 3L/R$

Example:
• $L = 7.5$ Mbits
• $R = 1.5$ Mbps
• End-to-end delay $= 15$ sec
Multi-Threading

• Threads execute concurrently as part of a process
• Benefits:
  – Allows for parallelism in a multiprocessor/multicore system
  – If a blocking call is made in one thread, other threads can continue executing
• Issues:
  – Memory is shared between threads, concurrent access requires proper synchronization
  – Order of execution of threads is non-deterministic
• Homework note: pass shared parameters to threads using a dedicated class instead of using global variables (see 463-sample.zip on course site)
Multi-Threading 2

- Reasons for using multiple threads in hw #1
  - Web servers respond slowly (1-10 seconds/request)
  - While a thread is suspended waiting for connect() and recv(), other threads should be allowed to work
- Multiple threads achieve significant speed-up
  - You could run thousands of threads, but limit your testing to 10 until you know it works correctly
- Common synchronization mechanisms
  - Mutex (mutual exclusion): allows only one thread access to critical section; others must wait
  - Semaphore: allows up to N concurrent threads
  - Event: binary (i.e., ON or OFF) signal
Multi-Threading 3

- Mutex usage
  - Any data structure (e.g., queue) or resource (e.g., screen or disk) modified by parallel threads needs to be protected
  - If not, inconsistencies (data corruption) may result

```c
CRITICAL_SECTION cs;
InitializeCriticalSection (&cs);

EnterCriticalSection (&cs);  // lock
// critical section here ...
LeaveCriticalSection (&cs);  // unlock
```

- Events
  - CreateEvent, WaitForSingleObject, CloseHandle
- See MSDN for additional details
Multi-Threading 4

• A semaphore has a numerical value \( s \) attached to it

• Wait on semaphore (operation P)
  - If \( s = 0 \), the semaphore suspends the calling thread
  - If \( s > 0 \), the thread is allowed access and \( s \) is set to \( s - 1 \)

• Release semaphore (operation V)
  - If threads are waiting, unblock one of them and run it
  - Otherwise, increment \( s = s + 1 \)

HANDLE sema = CreateSemaphore (...);
DWORD ret = WaitForSingleObject(sema, INFINITE); // wait
if (ret != WAIT_OBJECT_0)
  // report error

// critical section...

if (ReleaseSemaphore (sema, ...) == FALSE) // release
  // report error
